SLIM Microjet

40% power increase, only 1mm high!

New SLIM microjet escutcheon and body with directional eyeball completes and closes the series of the SLIM jets (Air and Mini), which excels in supertemporal modern design and practical usage. SLIM Microjet has in comparison with classical Microjet 40% higher massage effect and it is composed of the escutcheon and body together. Because we have managed to increase venturi's sucking effect of the jet, we could affort to miss regulation inner screw, which cannot be omit in the case of classical Microjet. But we went much further... Ergonomically solved anchorage of the positional directional eyeball solves also much better the situation, when the back jets could be overlied. Since the high of all the SLIM jets is only 1mm, all these jets are more effective and pleasanter while using the hydromassage bath than ordinary classical jets, whose high is 5mm.
