

3 in 1 new electronics U7TI

45% cheaper, 70% quicker!

70% time savings – thanks to quicker and easier connection by shell connector

3 in 1 – main control electronics (V5TPH) + StreamClean electronics (V2TPN) + heater control electronics (V1TT)

DIP – switcher for activation / decontamination of chosen functions

Thanks to integration of 3 electronics into 1 we have managed to decrease the price of the electronics that has led to the price reduction up to 45% against buying these 3 electronics separately. Using of shell connectors has led to the time savings up to 70% from the time needed before for the connection of these electronics among each other. Newly also the connection by the connectors for lighting, chromotherapy, water level sensor and controlling buttons are solved. Controlling is ensured by 7 buttons with the indication of the rightly running functions. The electronic uses the advanced logic of 2-function buttons, which enables to run the function that corresponds to the water being in the bath-tub or not. The presence of the water in the bath-tub evaluates the electronic by the water level sensor that protects also the pump and heater against running without water. Another possibility is connecting of another pump on the input of the heater, which extends the functionality of the whole massage system. The indicating diodes serves also as the help for the users – 1 flash at every 10 seconds at the appropriate button means that this function is available at the moment.

The message takes max. 25min, if it is not switched off earlier, then after 25min it is switched off automatically.

New electronic control U7TI has the following functions:

Air massage On/Off

- pulsation
- regulation +/-
- automatic drying

Water massage On/Off

- pulsation

Heater / water massage On/Off - another pump

Automatic desinfectant flush StreamClean

- Indication of desinfectant solution level in the store tank - water level sensor (only type 122041 HLS-K)

Automatic filling of the water into bath-tub up to high of water level sensor

Halogen lighting / LED CoolLight / Chromotherapy

- **Securing of pump and heater against running without water - water level sensor (only type 122041 HLS-K)** automatic limitation of massage duration on 25min

Halogen lighting (LED CoolLight) /
Chromotherapy possibility of hardware
activation/decontamination by jumper JP1

New and very quick way of connection by shell
connectors without necessity of using screw-driver

DIP switcher for activation/decontamination of selected functions:

- pulsation of water and air massage
- automatic drying
- automatic filling of the water into bath-tub up to high of water level sensor
- automatic desinfectant flush StreamClean
