

Levels check

We offer you a set for checking of two or three fluid levels. This set consists of control electronics and capacitive sensors of the fluid level for electronic control. No boring of the wall of compensatory pot or reservoir is needed, the sensors are bonded to outer side of the reservoir wall. The capacitive sensors, upon their sensitivity adjustment, work through PVC and non-conducting materials. Because the capacitive sensors are not inside the reservoir, this device is also able to check levels of aggressive, e.g. chemical fluids. The complete can be used instead overhead probes for level checking in compensatory reservoirs of pools, and also for checking of the minimum level in barrels for dosing of chemicals for pool watertreatment.

A reliable product, troublefree service..
